14. Questions a Resolution Must Answer (QARMA) 23

1. Letter from the Executive Board

Greetings delegates,

It is with great pleasure and gratitude that we serve as your Executive Board for the Committee on the Peaceful Uses of Outer Space at Oakridge Junior Model United Nations 2026.

This is a concise guide designed to give you a basic understanding of the agenda and the conduct of the simulation. Note that reading this guide alone will not be enough if you want to enjoy a healthy and competitive debate. Use the information in these pages as a catalyst for your own research.

Keep in mind that your discussion should include, but not be limited to, the points and content below. We highly encourage you to raise discussions beyond the scope of the Background Guide.

We will try our best to clarify any doubts you may have before the conference. However, we recommend reaching out to us as a last resort rather than a first option.

We look forward to seeing the highest level of debating skill and passion from you over the course of the conference.

Regards,
Chairperson: Shrey Vajpayee
Co-Vice Chairperson: Harini Reddy
Co-Vice Chairperson: Nitya Lanka

2. MUN Rules Of Procedure (ROP)

1. Roll Call

- The Chair calls on each country to declare if they are "Present" or "Present and Voting." It refers to the voting procedure on the Draft Resolution, where a delegate can vote "Yes", "No", or opt to "Abstain".
- If "Present and Voting," the delegate cannot abstain from voting. If the delegate chooses to respond with "Present", they may answer with "Present and Voting" on subsequent days, but this is not permissible for "Present and Voting" as this reply must be used consistently from that point forth.

2. Setting the Agenda

- Delegates motion to set the agenda, followed by a formal debate on which topic to discuss first. This motion requires a simple majority to pass.

3. Speakers' List

- After passing a motion to enter formal debate, delegates are placed on a speakers' list to make formal speeches. Time limits are set, and the Chair calls on delegates to speak in order.
- A delegate must raise their placard if they wish to add their name to this list. They can be on this list only once on any occasion.

4. Points

- **Point of Order:** To correct a procedural error by the Chair.
- **Point of Personal Privilege:** For personal discomfort (e.g., if the room is too cold, or if a fellow delegate cannot be heard).
- **Point of Inquiry:** To ask questions about discussion or statements in committee.
- **Point of Parliamentary Inquiry:** To ask questions with regard to the Rules of Procedure.

5. Motions

- **Motion to Suspend the Meeting:** To break for caucuses or adjourn the session.
- **Motion to Close Debate:** Ends the discussion on a topic and moves to voting. Requires a two-thirds majority.
- **Motion to Table the Topic:** Postpones debate on a topic. Requires a majority vote.

6. Yields

- **Yield to the Executive Board:** A delegate yields their remaining time from their speech to the Executive Board. It is to be used as they see fit.
- **Yield to Another Delegate:** A delegate yields their remaining time for another delegate to speak. (This delegate's permission must be sought beforehand.)
- **Yield to Points of Information:** A delegate yields their remaining time to Points of Information to the committee.
- **Yield to Comments:** A delegate yields their remaining time to comments from the committee.

7. Caucuses

- **Moderated Caucus:** The Chair controls the speaking order with shorter, focused speeches. The topic selected is a narrowed version of the agenda, chosen by the delegate who proposed the moderated caucus.
- **Unmoderated Caucus:** Informal discussion among delegates not under the moderation of the Executive Board.

8. Draft Resolutions and Amendments

- Delegates collaborate to create draft resolutions, which are formal solutions to the discussed issue.
- **Friendly Amendments:** Accepted by all sponsors without a vote.
- **Unfriendly Amendments:** Need to be voted on to be added.

9. Voting

- **Procedural Votes:** Includes motions and amendments; all members must vote.
- **Substantive Votes:** For resolutions and unfriendly amendments; only "Present and Voting" delegates may vote, and abstentions are allowed.

For a simpler explanation of the Rules of Procedure, see the ROP presentation (ROP PPT.pdf).

3. Important Points to Remember

A few things delegates should keep in mind while preparing:

3.1 Procedure

Procedural rules help keep debate organised and fair for everyone. The committee will follow the UNA-USA Rules of Procedure. The Executive Board will be fairly strict about the rules, but the real priority is always the agenda itself, so do not be afraid to speak up just because you are unsure about procedure.

3.2 Foreign Policy

Sticking to your country's foreign policy is one of the most important parts of Model UN. It is what makes Model UN different from other kinds of debate. Going against your country's foreign policy without a good reason is one of the biggest mistakes a delegate can make.

3.3 Role of the Executive Board

The Executive Board is there to guide debate, but the delegates are the ones who make the committee what it is. Speak up and share your country's position confidently. The Board may ask you questions or ask for clarification to keep debate moving and to test how well you know your position.

3.4 Nature of Source and Evidence

This Background Guide is for research purposes only and cannot be used as a source during the conference. Only the following sources can be used to back up a claim in formal debate:

- **United Nations:** Documents and findings from the United Nations or any UN body count as reliable proof for a claim.
- **Multilateral Organisations:** Documents from organisations such as the OIC, NATO, SAARC, BRICS, the EU, ASEAN, or the International Court of Justice can also be used as credible sources.
- **Government Reports:** These work the same way as state-run news agency reports, and can be challenged by another country at any time.
- **News Sources:** Reuters articles can be used if they clearly support or contradict a fact a delegate raises. State-run news agencies (like RIA Novosti for Russia or Xinhua for China) can be used for or against the country that owns them, but another delegate is always free to challenge them.

Please Note

Reports from NGOs working with UNESCO, UNICEF, and other UN bodies are accepted. Wikipedia and newspapers like The Guardian or the Times of India are never accepted as sources. That said, delegates can still quote or mention any source they like in their speeches, just not as formal proof.

3.5 Hierarchy of Evidence

Not all sources count the same in committee. Here is how evidence is ranked, from most to least reliable:

Tier	What it includes
Tier 1 (most reliable)	Anything published by the United Nations or one of its bodies, and any official statement or document released by a UN member state itself.
Tier 2	News from official, state-owned media, like Xinhua (China), Prasar Bharati (India), or the BBC (UK). Use this when no Tier 1 source is available.

Tier 3 (least reliable, but still usable)	International news outlets like Reuters, The New York Times, or Agence France-Presse. Use these only if nothing better is available.

3.6 Foreign Policy and Foreign Relations

Foreign policy is simply what your country wants to achieve on this issue, and in its relationships with other countries in general. It should guide everything you do in committee: the arguments you make, the reasons you give for them, and the actions you take.

Countries rarely hand you a list of their foreign policy, so you usually have to piece it together. Start with past meeting records from the UN body where your country has spoken on this issue. If those are not available, look for statements from your country's foreign ministry or top leaders (like the President, Prime Minister, or Foreign Minister).

Foreign relations are a bit different: they are about the actual ties your country has with others, like embassies and diplomatic partnerships. Foreign policy will usually matter more in committee, but it is worth keeping your country's foreign relations in mind too.

4. Introduction to Committee

The Committee on the Peaceful Uses of Outer Space (COPUOS) was set up by the General Assembly in 1959 to govern the exploration and use of space for the benefit of all humanity: for peace, security and development. The Committee was tasked with reviewing international cooperation in peaceful uses of outer space, studying space-related activities that could be undertaken by the United Nations, encouraging space research programmes, and studying legal problems arising from the exploration of outer space.

The Committee was instrumental in the creation of the five treaties and five principles of outer space. International cooperation in space exploration and the use of space technology applications to meet global development goals are discussed in the Committee every year. Owing to rapid advances in space technology, the space agenda is constantly evolving. The Committee therefore provides a unique platform at the global level to monitor and discuss these developments.

The Committee has two subsidiary bodies: the Scientific and Technical Subcommittee, and the Legal Subcommittee, both established in 1961. The Committee reports to the Fourth Committee of the General Assembly, which adopts an annual resolution on international cooperation in the peaceful uses of outer space.

4.1 The UN Office for Outer Space Affairs

The United Nations Office for Outer Space Affairs (UNOOSA) works to help all countries, especially developing countries, access and leverage the benefits of space to accelerate sustainable development. UNOOSA works toward this goal through a variety of activities that cover all aspects related to space, from space law to space applications.

UNOOSA helps countries build their capacity to develop and make the most out of the space sector through a two-fold approach: on one side, it provides resources such as training, workshops, conferences and knowledge-sharing portals; on the other side, it complements these with concrete opportunities for countries to expand their space capabilities, such as fellowships and competitive programmes, some of which specifically target developing countries, for example under its Access to Space 4 All Initiative.

In the area of disaster risk reduction, UNOOSA's dedicated programme, UN-SPIDER, helps countries use space data and technologies, such as satellite imagery, to prevent and manage disasters. UNOOSA also helps countries understand the fundamentals of international space law and increase their capacity to draft or revise national space law and policy in line with international normative frameworks on space. This is particularly important as more and more actors enter the space arena. UNOOSA supports transparency in space activities through measures such as the Register of Objects Launched into Outer Space, which it maintains, and which links each object to its responsible country.

UNOOSA works not only to promote sustainable development through space but also to ensure the sustainability of outer space activities, fostering international solutions to problems such as the rapid increase in space debris, to preserve space for future generations. UNOOSA works with space agencies and space leaders around the world to devise solutions to challenges that require an international response, such as the threat of a Near-Earth Object impact and the need to accelerate the compatibility of GNSS systems.

4.2 Committee Membership

In 1959, the United Nations General Assembly established the permanent Committee on the Peaceful Uses of Outer Space with 24 members. Since then, it has grown to 104 members, making it one of the largest committees in the United Nations. In addition to states, a number of international organisations, both intergovernmental and non-governmental, have observer status with COPUOS and its Subcommittees.

4.3 What Makes This Committee Different

Unlike committees that deal with conflict or crisis, COPUOS is mostly about cooperation. Most countries actually agree that spin-off benefits are a good thing, so the real debate is not about whether to support them, but about how to make sure they reach everyone fairly. That makes this a great committee for practising negotiation and compromise, since you will likely find more common ground with other delegates than you would in a committee built around disagreement.

5. Agenda Overview

Agenda: Spin-off Benefits of Space Technology: Review of Current Status (Agenda Item 10).

5.1 What Are "Spin-off Benefits" of Space Technology?

When engineers build something for a space mission, like a rocket, a satellite, or a system that keeps astronauts alive, they often invent new tools and materials along the way. Sometimes those inventions turn out to be useful right here on Earth too, in ways nobody originally planned for. That is what people mean by a "spin-off benefit" of space technology: something that was first built for space but ends up helping people in everyday life.

This agenda item asks COPUOS to look at what these benefits actually look like, how far they have spread around the world, and how the UN can help make sure every country gets to use them, not just the richest and most advanced ones.

Think about it this way. A satellite built to study weather patterns can also warn a fishing village about a storm before it hits. A system designed to track a spacecraft down to the exact metre can turn into the maps app that gets you home faster.

Space technology was never built with you specifically in mind, but somehow it still ends up helping you almost every day.

5.2 Why COPUOS Cares About This Topic

This topic connects directly to the Committee's main job: making sure space is used peacefully and for everyone's benefit, not just for a handful of powerful countries. UNOOSA says one of its biggest goals is to help every country, especially developing ones, get real use out of space, not just read about it in a report. So when COPUOS "reviews the current status" of spin-off benefits, it is really asking two things: what good is space technology doing for people right now, and is that good reaching everyone fairly?

6. Historical Background

6.1 History of the Topic at COPUOS

COPUOS has kept an eye on spin-off benefits almost since it was founded, because the space treaties it helped write say that space should be explored "for the benefit of all countries," no matter how developed they are. Over the years, delegates have brought up real examples from their own countries to show what this looks like in practice.

During one Fourth Committee debate on the peaceful uses of outer space, Israel described how its scientists were using remote sensing and satellite image processing to track water resources and farmland. Iran raised a similar point, explaining that satellite data could help identify usable farmland in regions where water is scarce. India talked about using satellites to run tele-education and tele-medicine programmes, including thousands of classrooms that trained teachers and nurses through its EDUSAT satellite system. Colombia held workshops on using satellite navigation for mapping and farming, Kazakhstan was busy building its own communications satellites, and China said it was shifting its space programme to focus more on communication, navigation, and remote sensing. Brazil made a point that still matters today: countries can only really benefit from satellite data if they also build up the human skills to use it, which is why training people matters just as much as having the technology itself.

At the same time, many developing countries pushed back on a real problem: not everyone has equal access to this technology. Cuba's delegate put it plainly, saying

that although every country has the right to explore space, not all countries have equitable access to space technologies. Iran agreed, pointing to a wide gap between developed and developing countries in science and space technology. This tension, between celebrating what space technology can do and making sure its benefits are actually shared fairly, is still at the heart of this agenda item today.

6.2 Timeline of Key Events

Year	What happened
1959	The UN General Assembly creates COPUOS with 24 members.
1961	The Legal Subcommittee and the Scientific and Technical Subcommittee are both established.
1963	The Declaration of Legal Principles, the first of the five principles, is adopted.
1967	The Outer Space Treaty enters into force, the foundation of all modern space law.
1968	The Rescue Agreement enters into force.
1971	UNOOSA's Programme on Space Applications is established.
1972	The Liability Convention enters into force.
1976	The Registration Convention enters into force.
1979–1984	The Moon Agreement is adopted and later enters into force.
1982	The Direct Broadcasting Principles are adopted.
1986	The Remote Sensing Principles are adopted, directly shaping how spin-off data gets shared.
1992	The Nuclear Power Sources Principles are adopted.
1996	The Declaration on International Cooperation is adopted, putting developing countries' needs front and centre.

Today	COPUOS has grown to 104 members and continues to track spin-off benefits each year under the Space2030 Agenda, with reviews scheduled for 2025 and 2030.

7. Understanding Law

COPUOS and its Legal Subcommittee are responsible for writing the main rules that govern what countries can and cannot do in space. Knowing them well will help you argue your country's position with confidence.

7.1 International Space Treaties

- **1967: The Outer Space Treaty** — basically the "constitution" of space law. It says outer space belongs to no one, that no country can claim the Moon or a planet as its own, and that space must be used for peaceful purposes only. It also makes countries responsible for whatever they, or their companies, do in space. This treaty is the one most directly connected to our topic, since it sets the rule that space exploration should benefit all peoples, not just the countries that get there first.
- **1968: The Rescue Agreement** — says that if astronauts land somewhere they were not supposed to, even in another country, that country has to help rescue them and send them home safely. It also covers returning space objects that fall back to Earth.
- **1972: The Liability Convention** — explains who pays if a piece of space debris or a satellite falls and causes damage. The country that launched the object is responsible for paying.
- **1976: The Registration Convention** — requires countries to tell the UN about every object they launch into space, so there is one central record of what is up there and who owns it.
- **1979: The Moon Agreement** — says the Moon and its resources belong to all of humanity, not just whichever country lands there first. It is the least popular of the five treaties. Only a small number of countries have joined it, mostly because major space powers were not comfortable sharing control over resources that might one day be mined from the Moon.

7.2 The Five Declarations and Principles

Along with the treaties, COPUOS has also agreed on five sets of principles that guide specific areas of space activity.

- **The 1963 Declaration of Legal Principles:** The very first UN statement saying space should be explored for the good of everyone, and that no country can own it.
- **The Direct Broadcasting Principles (1982):** Set rules for satellite TV broadcasts that cross into another country, so broadcasters respect each country's sovereignty.
- **The Remote Sensing Principles (1986):** Directly connected to our topic. Data collected by Earth-observation satellites, used for things like tracking farmland, water, or natural disasters, should be shared with the countries being observed, especially developing ones.
- **The Nuclear Power Sources Principles (1992):** Set safety rules for spacecraft that use nuclear power, including telling other countries if something goes wrong.
- **The 1996 Declaration on International Cooperation:** Says space exploration should especially take into account the needs of developing countries. This is probably the single most important principle for this agenda item, since it is basically the UN promising that the benefits of space should not be limited to a few wealthy nations.

8. Current Status: What Is Being Done

A lot of the "current status" work on this topic happens through UNOOSA's ongoing programmes. Here are the big ones delegates should know about.

- **The Programme on Space Applications:** Started in 1971, this is UNOOSA's main tool for closing the gap between countries with advanced space programmes and those without one. It offers training, workshops, fellowships, and regional centres so more countries can actually use space data, not just watch other countries use it.
- **UN-SPIDER:** Short for the UN Platform for Space-based Information for Disaster Management and Emergency Response. It helps countries use

satellite data, especially imagery, to prepare for and respond to disasters like floods, fires, and earthquakes.

- **Access to Space for All:** A newer initiative connecting countries, especially developing ones, with opportunities like satellite-building projects, so they are not just receiving space benefits but learning to build the technology themselves.
- **The International Committee on GNSS (ICG):** Works on making sure satellite navigation systems built by different countries, like GPS, can work well together, which matters because so many spin-off technologies depend on accurate positioning.
- **The Register of Objects Launched into Outer Space:** A master list that UNOOSA keeps to track who owns what in orbit, supporting the transparency goals set out in the Registration Convention.
- **The Space2030 Agenda:** COPUOS's current long-term plan. One of its stated goals is to promote spin-off benefits of space technology for sectors outside the space industry, while also encouraging the growth of a global space economy, including small and medium-sized businesses, and connecting space activities to the UN's wider Sustainable Development Goals. A mid-term review was scheduled for 2025, with a full review set for 2030.

9. Real Spin-off Examples

It helps to really sit with a few of these examples instead of just skimming past them, since they show how different the applications can be.

9.1 Farming and Water

Satellites built to study the Earth from orbit can also take detailed pictures of farmland and water sources. Israeli researchers have used this kind of remote sensing, combined with image processing and mapping software, to manage water resources across large areas. Iran raised a similar use case, using satellite data to figure out which land was actually fit for farming in regions where water is limited. For a farmer who has never touched a spacecraft, this still means better crop planning and less wasted water.

9.2 Disaster Response

UN-SPIDER exists because satellite images can show a flood spreading or a wildfire growing in close to real time, long before anyone on the ground could map it by hand. Countries that cannot afford their own satellites can still request this imagery, which turns a space-based tool into something that can quite literally save lives during an emergency.

9.3 Health and Education

India's EDUSAT programme used a satellite to connect thousands of classrooms for tele-education and tele-medicine, training teachers and nurses in places that would otherwise be hard to reach. It is a good example of how a single satellite can support two completely different public services at once.

9.4 Navigation

Every time a phone gives you directions, it is talking to a GNSS network, the kind of system the ICG works to keep compatible across countries. Colombia has run workshops specifically on using satellite navigation for mapping and farming, showing how a tool built for positioning spacecraft turned into something farmers and city planners use daily.

9.5 Weather and Climate

Weather and climate might be the spin-off benefit that touches the most people every single day. Satellites built to study the atmosphere feed the forecasts your weather app shows you every morning, and the same data helps scientists track long-term climate patterns, like rising sea levels or shifting rainfall. UNOOSA connects this work to its broader push for sustainability, tying space activities to real, measurable goals for protecting the planet rather than treating space as something separate from life on Earth.

None of this happened by accident. Every one of these benefits traces back to a specific rule or programme that COPUOS member states agreed to, which is exactly why the work you will be doing in committee, writing clauses, negotiating wording, and voting on a resolution, actually matters.

10. Stakeholder and Bloc Analysis

Like most topics at COPUOS, countries do not divide neatly into two sides. It helps to think of positions as falling across a few general groups, and your own country might not fit perfectly into just one.

Group	General position
Established spacefaring nations	Countries that already run large space programmes tend to focus on growing the space economy, supporting private space companies, and protecting the research that produced their own spin-off technologies. They are generally supportive of cooperation, but want to make sure that sharing technology does not come at the cost of their own space industries.
Emerging space nations	Countries that have started building their own satellites or space agencies, but are not yet major space powers, often push hardest for capacity-building and training programmes like those run through UNOOSA's Programme on Space Applications. They want real partnerships, not just access to finished data.
Developing nations without space programmes	These countries, as Cuba and Iran pointed out, often raise the equitable access gap directly. Their priority tends to be guaranteed, affordable access to things like disaster imagery, GNSS signals, and remote sensing data, along with a say in how space benefits get distributed, even if they never launch a satellite of their own.

11. Current Challenges

Spin-off benefits do not happen automatically, and a few ongoing challenges make this topic trickier than it first looks.

11.1 Space Debris

As more satellites go up, more broken pieces and leftover parts stay in orbit as debris. A crowded, debris-filled orbit puts the satellites that produce spin-off benefits, like weather and disaster monitoring, at risk of being damaged. UNOOSA works with space agencies around the world to find solutions to this problem.

11.2 Near-Earth Object Monitoring

Tracking asteroids and other objects that pass close to Earth takes the same kind of satellite and sensor technology used for other spin-off applications, so investment in one often supports the other.

11.3 Keeping GNSS Systems Compatible

As more countries build their own satellite navigation systems, they need to work well together so a phone or ship anywhere in the world can still get an accurate position. The ICG exists specifically to manage this.

11.4 A Fast-Growing Private Space Industry

More and more space activity is now run by private companies instead of governments. This has sped up innovation, but it also raises the question of whether spin-off benefits will keep reaching everyone fairly, or mostly go to whoever can pay for them.

12. Research Guidance

12.1 Frequently Asked Questions

My country does not have a space programme. What do I even say? That is completely fine; several countries in this committee may not have one either. Focus on how your country uses space technology that already exists, things like weather forecasts, GPS, phone and internet signals, or disaster warnings. Every country uses some of these, even without launching anything into orbit.

Can I bring up space debris or space weapons in this debate? You can mention them briefly if they are relevant to your point, but try to keep your speeches focused on the actual agenda item, spin-off benefits. If the committee wants to spend real time on debris or weapons, that usually needs its own motion to set a different agenda item.

What's the difference between this topic and "space exploration" in general? Space exploration is about missions, like sending a rover to Mars or astronauts to the Moon. This topic is about what happens afterward: the tools and ideas that come out of those missions and end up helping people who will never go anywhere near a rocket.

Do I need to know a lot of science to debate this well? No. You need to understand what the technology does and who it helps, not how to build it. Knowing that remote sensing satellites track farmland is enough; you do not need to know how the sensors themselves work.

What makes a good clause in our resolution? A good clause is specific. Instead of writing "encourages more space cooperation," try something like "calls for a doubling of UNOOSA fellowship spots for developing countries by 2030." The more specific your clause, the easier it is for the committee to actually act on it.

12.2 Tips for Writing Your Position Paper

- **Start with your country's general stance:** Does your country have a space programme? Does it rely on data or technology shared by other countries? A sentence or two is enough to set the scene.
- **Mention past involvement:** If your country has spoken about this topic before, at COPUOS, the Fourth Committee, or anywhere else in the UN, mention it. If you cannot find anything specific, speak to your country's general voting record on international cooperation and development.
- **Explain your country's priorities:** Is your country more focused on building its own space industry, getting access to training, or receiving disaster and farming data? Be honest about what would actually matter to your country.
- **Propose one or two solutions:** Pick one or two ideas from this guide, or come up with your own, and explain in detail why your country would support them.
- **Keep it short:** One to two pages is usually plenty.

12.3 Sources for Further Research

- United Nations Treaties and Principles on Outer Space
- UNOOSA: Our Work
- UNOOSA: Programme on Space Applications
- Space2030 Agenda zero draft (A/AC.105/C.2/2019/CRP.10)
- UN press release, Fourth Committee debate on outer space (GA/SPD/347, 2006)
- UNOOSA: History: Treaties

- UNOOSA: COPUOS session page
- Space2030 / Space Economy white paper
- General Assembly resolution A/RES/77/121 (2022)

12.4 A Final Word

Space can feel like a strange topic to debate in a classroom, since none of us are likely to launch a rocket anytime soon. But almost everything in this guide, the weather forecast you check before school, the map that gets you to a new restaurant, the warning that tells a village a storm is coming, started out as something built for space. Keep that in mind as you prepare. This committee is not really about outer space at all; it is about making sure something built far away ends up helping people right here.

13. Pointers from the Online Session

A recap for those who attended, and mainly for delegates who could not attend.

1. Devices will be permitted throughout, except during a few critical procedures. This rule is subject to change based on committee proceedings.
2. All speeches must be printed or handwritten. If you choose to speak impromptu, there is no need for this.
3. Physical copies of position papers must be submitted during the first committee session of the conference without fail.
4. Be respectful to other delegates, and to IP and OC members.
5. Focus equally on the delivery of your speech and its content.
6. The documentation for the committee will be disclosed towards the end of Day 1.
7. Come prepared with a few moderated caucus topics and a few GSL speeches.
8. **The most important one:** do NOT use AI to write your speeches. Use your head.

14. Questions a Resolution Must Answer (QARMA)

1. **Promoting the benefits of space technology:** Resolutions directly call for the committee to "promote the benefits of space technology and its applications," which is this agenda item in a single phrase. Does your resolution say how those benefits should reach more people, not just that they exist?
2. **Capacity-building for developing countries:** Nearly every resolution points to UNOOSA's Programme on Space Applications and the Office's "central role" in helping developing countries, including with national space policy and legislation. Does yours say how training and support should actually expand?
3. **Disaster management:** Resolutions regularly note UN-SPIDER and link it to the Sendai Framework for disaster risk reduction. Does your resolution strengthen this kind of work, or propose something new for emergency response?
4. **GNSS compatibility:** Past texts note the ICG's progress on keeping satellite navigation systems compatible with each other, since so many spin-off benefits depend on accurate positioning. Does your resolution touch on how countries should coordinate their navigation systems?
5. **Funding:** Resolutions routinely appeal for voluntary contributions to UNOOSA's trust fund, especially to support developing countries. Where would the funding for your resolution's ideas actually come from?

Good luck with your research, and we will see you in committee!

Executive Board, COPUOS
